

PERFORMANCE PROTOCOL

Better prepared GI Tract Better Recovery!

A consistent winner is a horse that is fresh and well nourished. Training and competition stress can cause the horse to stop eating for days, leaving them totally flat on the last day of the competition. Working horses expend extra energy, adding stress to the GI Tract. Stress is most severe in the hindgut where the majority of fermentation takes place. It can leave a horse's gastro intestinal tract very sore, causing loss of appetite. EquiOtic is actual Equine L. reuteri, that supports and maintains the GI tract, giving you that needed edge to win!

Daily Maintenance

- Step 1: Feed EquiOtic daily packets. Higher the performance, higher the stress. 2-3 packets daily. (You cannot overdose)
- Step 2: 45 min. before breezing, hard workouts or trailering give 20cc. (Step 2 option: give 30cc EquiOtic paste for recovery after shower)
- Step 3: Continue with paste until horse eats

On Race/Show Day

- Step 1: Feed desired packets or paste
- Step 2: 30 minutes before race/event give 20 to 30 cc of paste.
- Step 3: After event, 20-30cc of EquiOtic paste as soon as possible.
- Step 4: Evening/PM feeding: give horse additional 20-30cc paste. Continue to give paste per above steps until normal appetite returns.
